

Briefing Note – Commonwealth Climate Change Policy Updates

30 September 2025

Summary

- The <u>Australian Government</u> has released a suite of climate change policy updates to inform and guide Australia's action in response to increasing climate risks and emission reduction targets.
- The <u>National Climate Risk Assessment</u> (NCRA) is Australia's first comprehensive national assessment of climate risks, aiming to inform adaptation planning and policy at all levels of government, business and community.
- The <u>National Adaptation Plan</u> (NAP) compliments the NCRA by providing the framework for adapting to nationally significant climate risks and setting a vision for a resilient Australia where adaptation actions are effective, coordinated and undertaken by those best placed to manage the risk.
- The Australian Government also released a <u>Net Zero Plan</u>, pledging to cut emissions by 62-70% of 2005 levels by 2035. The Net Zero Plan is backed by an \$8 billion fund to target heavy industry and technological advancements.
- The Department of Climate Change, Energy, the Environment and Water (DCCEEW) will be hosting **two briefing sessions for Local Government** on these updates in the coming weeks, with dates still to be scheduled.
- Nationally, <u>ALGA</u> has been advocating for \$400 million per year climate adaptation fund, to be distributed across all Local Governments to provide local, place-based solutions to Australia's changing climate.
- WALGA has been advocating for \$210 million over the next five years to build resilience and adapt to the localised impacts of climate change through initiatives such as urban greening, coastal management and upgrades to essential public infrastructure.

1. National Climate Risk Assessment

The National Climate Risk Assessment (NCRA) is Australia's first comprehensive national assessment of climate risks, aiming to inform adaptation planning and policy at all levels of government, business and within the community.

The Risk Assessment identifies 63 nationally significant risks across eight key systems (including health, infrastructure, economy, environment and food systems), with 11 priority risks selected for deeper analysis mapped against three global warming scenarios—1.5°C, 2°C and 3°C. The Climate Change Authority indicated that, based on current global commitments, the world is on track to see 2.9C of warming this century.

RIVERINE FLOODS

A decrease in maximum daily runoff and annual runoff totals is possible (low confidence) indicating less frequent riverine floods do occur, they are likely to be higher due to higher event rainfall totals (m confidence). Southern and particularly south-western Australia are projected to experience reduced runoff. In contrast, parts of the east coast and tropics are likely to see an increase in heavy runoff events which could lead to higher risks of flooding.

medium confidence). Little

change or a small southward

is possible (low confidence)

shift in tropical cyclone tracks

HIGH TEMPERATURES

Extreme temperatures are likely to increase nationwide (very high confidence), with the greatest increases over northern Australia, the Great Dividing Range in the southeast, and in desert regions. Severe and extreme heatwave events are projected to double if global warming reaches +2.0°C and more than quadruple under +3 0°C of warming

Sea levels around Australia will continue to rise (very high confidence), with a median projection of half a metre by the end of the century. Far higher levels cannot be ruled out this century if polar ice sheets collapse (low confidence). As sea levels rise, coastal flood events are projected to become more frequent, accompanied by greater levels of coastal erosion and shoreline ch (high confidence). By 2090, coastal erosion even may occur around 10 times more often than now.

DROUGHT

Time spent in drought is likely to increase across most of the country (low to medium confidence), particularly in southern and eastern ar Drying in the southwest of the nation, where increased time in drought has occurred since the 1970s, is projected to increase at all future levels of global warming (high confidence). Long-term changes towards drier conditions are likely to occur in parts of southern Australia. with higher confidence of such change for southwest Australia

bushfires in most currently forested areas (high confidence). However, some areas may see less intense fires later in the century as forests transition to grassland, reducing fire fuel loads. Dangerous fire weather days are projected to become more frequent in southern and eastern areas with a longer fire season and the potential for more megafires (high confidence). Northern regions are projected to have an increased susceptibility to savannah fire as rainfall patterns and vegetation change

STORMS

Extratropical storms (including east coast lows) are projected to become less frequent (medium confidence); however, they may have greater impacts when they do occur (medium confidence). Changes in rainfall intensity and sea levels mean a higher chance of coastal flooding from future extratropical storms. Convective storms producing large hail may increase in the east and occur further south (low confidence).

OCEAN WARMING AND ACIDIFICATION

Oceans surrounding Australia are expected to become more acidic (high confidence) and warmer, with more frequent and longer marine heatwaves (high confidence). The ocean environment will become more stressful for marine organisms, with a higher chance of coral bleaching. Marine heatwaves will become more frequent, particularly in the Tasman Sea, In Antarctic waters, more acidic oceans will mean some areas may become incapable of supporting the development of shells and coral skeletons.

Australia's National Climate Risk Assessment: An Overview | 2025

11

1.1. **Key National Findings**

The key national findings include that there are:

- Escalating Hazards: Extreme heat, bushfires, floods and coastal inundation will become more intense, frequent and widespread.
- Compounding Risks: Climate impacts will rarely occur in isolation; events are expected to overlap or cascade, affecting multiple systems at once.
- Vulnerable Groups: The most at-risk include Aboriginal and Torres Strait Islander peoples, regional and remote communities, the very young and older Australians, outdoor workers and those already disadvantaged.
- Coastal Risks: More than 1.5 million Australians could be living in high-risk coastal flood zones by 2050.
- Increasing Heat-Related Death risk: Under a 3°C scenario, heat-related deaths could increase by 300% in Perth, with similar jumps in other major cities.
- Economic Impacts: Productivity losses from extreme heat could reach \$135-423 billion by 2063, with agriculture, construction, manufacturing, and mining (all key WA sectors) among the hardest hit.

The Risk Assessment also includes findings to guide the new National Adaptation Plan, with a focus on building resilience in the most vulnerable regions, including Western Australia. The Risk Assessment also identifies the urgency of action to reduce the potential impacts.

1.2. Western Australia Specific Findings

The Risk Assessment split the risk rating for WA into WA north and south, with different risks being more significant in these areas. Overall, for Western Australia, particularly its northern and coastal regions, faces escalating risks from extreme heat, sea level rise and compounding climate hazards. These will impact health, infrastructure, primary industries, and community resilience. The NCRA highlights the urgent need for both emissions reduction and targeted adaptation, particularly in vulnerable regions like WA

Overall, for Western Australian, the Risk Assessment found:

- Hardest Hit: The assessment finds that northern Western Australia will be among the
 hardest hit by climate change, especially from extreme heat, increased risk of vector borne
 disease and a range of natural disasters. In all climate change scenarios public buildings in
 this region are significantly impacted.
- Liveability Concerns: Without strong adaptation, and emissions reduction, some areas in the north may become unliveable and uninsurable due to compounding hazards like heatwaves, cyclones and floods.
- Supply Chains: Disruption to supply chains (e.g., from cyclones) is already occurring and will worsen, affecting food production and distribution.
- Biodiversity: Unique ecosystems in WA are at risk of collapse due to rising temperatures and changing rainfall patterns.

This map illustrates examples of the climate risks and impacts across Australia.

Increases in extreme heat and heatwaves will increase health risks and heat-related mortality, making it harder to work outdoors and respond to disasters.

The risk of vector-borne diseases (e.g. malaria and dengue fever) will rise as temperatures, rainfall, and floods increase, straining the healthcare system.

Crop yields will decrease with more drought (e.g. southwest Western Australia) and increased susceptibility to fire (e.g. southern and eastern Australia)

Disruptions to supply chains from more severe rainfall and flood events can result in many regional and remote communities not receiving goods. Distribution costs will also increase, particularly the cost of transporting medicines.

Many ecosystems, such as Eucalypt woodlands, will have a lower capacity to support biodiversity under future climate change.

Sea level rise and increased coastal hazards will significantly impact coastal communities and cities.

Coral reefs (e.g. the Great Barrier Reef and Ningaloo reef) will face ever increasing risks of bleaching and biodiversity loss as oceans warm and acidity increases.

Changes to the East
Australian Current will cause
increased 'tropicalisation',
bringing more warm water
southwards, and increasing risks
to temperate ecosystems along
southeast coastal regions.

Water availability and accessibility for towns, ecosystems and agriculture may become limited due to rising evapotranspiration in inland regions and changes in annual rainfall.

Critical infrastructure, such as power lines and telecommunications, is likely to experience increased pressure and damage from increased climate hazards.

2. National Adaptation Plan

The National Adaptation Plan (NAP) sets out a national framework for adapting to climate risks that are nationally significant. It sets a vision for a resilient Australia where adaptation actions are effective, coordinated and undertaken by those best placed to manage the risk—whether government, business or households.

The NAP covers seven key systems: economy, infrastructure, environment, primary industries and food, health and social support, communities (urban, regional, remote) and defence/national security.

The NAP sets a clear direction for climate adaptation in Australia, with Local Governments recognised as instrumental in adaptation. Local Governments are responsible for managing local risks, supporting community resilience and integrating adaptation into core business.

The Australian Government has committed to working with States, Territories, and Local Government to create an implementation action plan for the NAP. This will give effect to priority actions identified for all levels of government.

Through the Australian Local Government Association (ALGA), WALGA will continue to feed into national discussions on the implantation action plan that will fund and inform on-ground activity.

2.1. Impact on Local Government

Local Governments are recognised as "instrumental" in delivering climate adaptation. Their main roles include:

• Infrastructure and built environment:

o Managing risks and impacts to public assets and service delivery they own and manage (e.g. local roads, parks, drainage, flood resilience)

• Communities (Urban, regional and remote)

- o Building the capacity of local communities and businesses to adapt to climate change.
- o Councils are closest to communities and have local knowledge, making them best placed to deliver adaptation that meets local needs.
- o Integrating climate projections into land use planning, asset management and service delivery

Health and social support

o Through community centres, environmental and public health services, aged care and emergency relief

Natural environment

o Such as urban greening, bushfire preparedness, coastal management and water security

• Defence and national security

o Emergency management and disaster recovery

Local Government adaptation actions (like urban greening, floodplain retreat, bushfire programs, and planning for sea level rise) deliver significant national economic, social and environmental benefits.

Local Government face significant financial constraints and increasing demands due to more frequent and severe climate impacts. The NAP acknowledges the need for better coordination, long-term funding and regulatory clarity to support Local Government action, representing a positive step in the acknowledgement that Local Government require scaled investment and resources to support on-ground adaptation activity.

3. Net Zero Plan

The Net Zero Plan sets out Australia's pathway to reduce emissions by 62–70% below 2005 levels by 2035 and achieve net zero emissions by 2050. The Plan identifies that actions taken across the Australian economy reduced emissions in 2025 by 27% on 2005 levels.

The Plan is built around five decarbonisation priorities:

- 1. Clean electricity across the economy
- 2. Lowering emissions by electrification and efficiency
- 3. Expanding clean fuel use
- 4. Accelerating new technologies
- 5. Net carbon removals scaled up.

Six sectoral plans (electricity and energy, industry, resources, built environment, agriculture and land and transport) provide detailed pathways for emissions reduction, backed by an \$8 billion funding package that aims to ensure a fair, orderly and efficient transition that grows the economy, creates jobs, and delivers benefits for households, businesses, and communities.

The Net Zero Plan emphasises place-based partnerships, with Local Governments working alongside Australian and State Governments, industry, and communities to ensure decarbonisation efforts are practical and tailored to local needs.

3.1. Role of Local Government in the Net Zero Plan

Local Governments are recognised as "vital partners" of the net zero transition. They are at the frontline of climate change impacts and are critical to delivering a thriving net zero future.

The Plan identifies that Local Governments play a pivotal role through:

- Reducing emissions from their own operations and assets (responsible for about 1.5% of national emissions).
- Adapting to climate change impacts at the local level
- Land-use planning
- Delivery of local transport
- Waste and recycling services

The Net Zero Plan positions Local Governments as essential partners in Australia's transition to Net Zero. Councils are responsible for both direct emissions reduction and enabling broader community action. Their local knowledge, community trust, and ability to deliver place-based solutions make them critical to achieving national climate goals. However, unlocking their full potential will require stronger support, scaled investment, and collaboration across all levels of government.

3.2. Comparison of Australia's Emissions Targets: 2030 and 2035

	2030 Target (set in 2015)	2030 Target (set in 2022)	2035 Target (set in 2025)
Emissions reduction goal	Reduce emissions by 26–28% below 2005 levels	Reduce emissions by 43% below 2005 levels	Reduce emissions by 62–70% below 2005 levels
Funding	Previously supported by annual budget allocations of funding	Previously supported by annual budget allocations of funding	Now supported by targeted initiatives and funding as part of the Net Zero Plan
Legislation	No legislated target; policy-based commitment	Climate Change Act 2022	Climate Change Act 2022 + Climate Change Authority advice
Policy instruments	Emissions Reduction Fund, Safeguard Mechanism, voluntary offsets	Safeguard Mechanism, Rewiring the Nation, EV incentives	Expanded Safeguard Mechanism, New Vehicle Efficiency Standard, Cheaper Home Batteries Program
Sectoral focus	Economy-wide, with emphasis on low-cost abatement	Energy, transport, industry	Sector-specific plans across energy, transport, industry, resources, agriculture and built environment
International alignment	Paris Agreement Nationally Determined Contribution (NDC) submitted in 2015	Paris Agreement NDC	Updated NDC submitted to UN; aligned with global 1.5°C pathway
Economic framing	Climate action framed as compatible with economic growth	Climate action as risk mitigation	Climate action as opportunity: 'Future Made in Australia' strategy
Progress to Date	Target seen as insufficient; emissions reductions modest	~42.6% reduction projected by 2030	On track to meet 43% reduction by 2030; 2035 target seen as ambitious but achievable
Net Zero Commitment	No formal net zero commitment	Net zero by 2050	Net zero by 2050 (unchanged)
